**SUBSTITUTED THIOPHENES AND USES THEREOF****Field of the invention**

5           The present invention relates to novel substituted thiophenes, their pharmaceutical compositions and methods of use. In addition, the present invention relates to therapeutic methods for the treatment and prevention of cancers.

**Background of the invention**

10

Chemotherapy and radiation exposure are currently the major options for the treatment of cancer, but the utility of both these approaches is severely limited by adverse effects on normal tissue, and the frequent development of tumor cell resistance. It is therefore desirable to improve the efficacy of such treatments in a way that does not increase the toxicity associated with them.

15       One way to achieve this is by the use of specific sensitizing agents such as those described herein.

          An individual cell replicates by making an exact copy of its chromosomes, and then segregating these into separate cells. This cycle of DNA replication, chromosome separation and division is regulated by mechanisms within the cell that maintain the order of the steps and ensure that each step is precisely carried out. Involved in these processes are the cell cycle checkpoints (Hartwell *et al.*, *Science*, Nov 3, 1989, 246(4930):629-34) where cells may arrest to ensure DNA repair mechanisms have time to operate prior to continuing through the cycle into mitosis. There are two such checkpoints in the cell cycle – the G1/S checkpoint that is regulated by p53 and the G2/M checkpoint that is monitored by the Ser/Thr kinase checkpoint kinase 1 (CHK1).

25

          The cell cycle arrest induced by these checkpoints is a mechanism by which cells can overcome the damage resulting from radio- or chemotherapy, their abrogation by novel agents should increase the sensitivity of tumor cells to DNA damaging therapies. Additionally, the tumor specific abrogation of the G1/S checkpoint by p53 mutations in the majority of tumors can be exploited to provide tumor selective agents. One approach to the design of chemosensitizers

30

- 2 -

that abrogate the G2/M checkpoint is to develop inhibitors of the key G2/M regulatory kinase CHK1, and this approach has been shown to work in a number of proof of concept studies. (Koniaras *et al.*, *Oncogene*, 2001, 20:7453; Luo *et al.*, *Neoplasia*, 2001, 3:411; Busby *et al.*, *Cancer Res.*, 2000, 60:2108; Jackson *et al.*, *Cancer Res.*, 2000, 60:566).

Some of the compounds of the present invention are capable of forming salts with various inorganic and organic acids and bases and such salts are also within the scope of this invention. For example, such conventional non-toxic salts include those derived from inorganic acids such as hydrochloric, phosphoric, and the like; and the salts prepared from organic acids such as lactic,  
25 maleic, citric, benzoic, methanesulfonic, trifluoroacetate and the like.

In one embodiment a compound of the formula (I) or a pharmaceutically acceptable salt thereof for the therapeutic treatment (including prophylactic treatment) of mammals including humans, it is normally formulated in accordance with standard pharmaceutical practice as a pharmaceutical composition.

- 29 -

In addition to the compounds of the present invention, the pharmaceutical composition of this invention may also contain, or be co-administered (simultaneously or sequentially) with, one or more pharmacological agents of value in treating one or more disease conditions referred to herein.

5           The term composition is intended to include the formulation of the active component or a pharmaceutically acceptable salt with a pharmaceutically acceptable carrier. For example this invention may be formulated by means known in the art into the form of, for example, tablets, capsules, aqueous or oily solutions, suspensions, emulsions, creams, ointments, gels, nasal  
10           sprays, suppositories, finely divided powders or aerosols or nebulisers for inhalation, and for parenteral use (including intravenous, intramuscular or infusion) sterile aqueous or oily solutions or suspensions or sterile emulsions.

          Liquid form compositions include solutions, suspensions, and emulsions. Sterile water or water-propylene glycol solutions of the active compounds may be mentioned as an example of  
15           liquid preparations suitable for parenteral administration. Liquid compositions can also be formulated in solution in aqueous polyethylene glycol solution. Aqueous solutions for oral administration can be prepared by dissolving the active component in water and adding suitable colorants, flavoring agents, stabilizers, and thickening agents as desired. Aqueous suspensions for oral use can be made by dispersing the finely divided active component in water together with a  
20           viscous material such as natural synthetic gums, resins, methyl cellulose, sodium carboxymethyl cellulose, and other suspending agents known to the pharmaceutical formulation art.

          The pharmaceutical compositions can be in unit dosage form. In such form, the composition is divided into unit doses containing appropriate quantities of the active component. The unit dosage form can be a packaged preparation, the package containing discrete quantities of the preparations, for example, packeted tablets, capsules, and powders in vials or ampoules.  
25           The unit dosage form can also be a capsule, cachet, or tablet itself, or it can be the appropriate number of any of these packaged forms.

          Compounds of formula (I) have been shown to inhibit checkpoint kinase activity in vitro. Inhibitors of checkpoint kinase have been shown to allow cells to progress inappropriately to the metaphase of mitosis leading to apoptosis of effected cells, and to therefore have anti-  
30           proliferative effects. Therefore it is believed that the compounds of formula (I) may be used for

the treatment of neoplastic disease. Hence compounds of formula (I) and their salts are expected to be active against neoplastic disease such as carcinoma of the brain, breast, ovary, lung, colon, prostate, skin or other tissues, as well as leukemias and lymphomas, tumors of the central and peripheral nervous system, and other tumor types such as melanoma, sarcomas, fibrosarcoma and osteosarcoma. In addition, compounds of formula (I) are also expected to be useful for the treatment other proliferative diseases. It is expected that the compounds of formula (I) would most likely be used in combination with a broad range of DNA damaging agents but could also be used as a single agent.

Generally, the compounds of formula (I) have been identified in one or both assays described below as having an  $IC_{50}$  value of 100 micromolar or less. For example compound of example 2 has an  $IC_{50}$  value of 10 nM.

Checkpoint Kinase 1 Assay: This in vitro assay measures the inhibition of CHK1 kinase by compounds. The kinase domain is expressed in baculovirus and purified by the GST tag. Purified protein and biotinylated peptide substrate (Cdc25C) is then used in a 384 well automated Scintillation Proximity Assay (SPA). Specifically, peptide, enzyme and reaction buffer are mixed and aliquoted into a 384 well plate containing dilution series of compounds and controls. Cold and hot ATP are then added to initiate the reaction. After 2 hours, a SPA bead slurry, CsCl<sub>2</sub> and EDTA are added to stop the reaction and capture the biotinylated peptide. Plates are then counted on a Topcount. Data is analyzed and  $IC_{50}$ s determined for individual compounds.

Abrogation Assay: This cellular assay measures the ability of CHK1 inhibitors to abrogate the DNA-damage induced G2/M checkpoint. Compounds active against the enzyme (< 2  $\mu$ M) are tested in the cellular assay. Briefly HT29 cells (colon cancer cell line, p53 null) are plated in 96 well plates on day 1. The following day, cells are treated with camptothecin for 2 hours to induce DNA damage. After 2 hours, camptothecin is removed and cells are treated for an additional 18 hours with test compound and nocodazole, a spindle poison that traps in cells in mitosis that abrogate the checkpoint. Cells are then fixed with formaldehyde, stained for the presence of phosphohistone H3, a specific marker for mitosis and labeled with Hoechst dye so that cell number can be measured. Plates are scanned using the Mitotic Index protocol on the Array Scan (Cellomics). As a positive control for abrogation, 4 mM caffeine is used.

Compounds are tested in a 12-point dose response in triplicate. Data is analyzed and EC50s determined for individual compounds.

The compounds of the present invention can be prepared in a number of ways well known to one skilled in the art of organic synthesis. The compounds of the present invention can be synthesized using the methods described below, together with synthetic methods known in the art of synthetic organic chemistry, or variations thereon as appreciated by those skilled in the art. Such methods include, but are not limited to, those described below. All references cited herein are hereby incorporated in their entirety by reference.

The novel compounds of this invention may be prepared using the reactions and techniques described herein. The reactions are performed in solvents appropriate to the reagents and materials employed and are suitable for the transformations being effected. Also, in the description of the synthetic methods described below, it is to be understood that all proposed reaction conditions, including choice of solvent, reaction atmosphere, reaction temperature, duration of the experiment and workup procedures, are chosen to be the conditions standard for that reaction, which should be readily recognized by one skilled in the art. It is understood by one skilled in the art of organic synthesis that the functionality present on various portions of the molecule must be compatible with the reagents and reactions proposed. Such restrictions to the substituents, which are not compatible with the reaction conditions, will be readily apparent to one skilled in the art and alternate methods must then be used.

The starting materials for the examples contained herein are either commercially available or are readily prepared by standard methods from known materials. For example the following reactions are illustrations but not limitations of the preparation of some of the starting materials and examples used herein.

General procedures for making the compounds of the invention is as follows:

- 32 -

The first of these procedures initiates from a common intermediate. This intermediate 2-aminothiophene core is produced by a one-pot Gewald synthesis from reaction of cyanomethylacetate with various benzaldehydes and elemental sulfur under basic conditions shown below in Scheme I.

Scheme I

If not commercially available, the corresponding benzaldehydes could be synthesized using some or all of the transformations described in Scheme II.

Scheme II

Compounds of Formula (I) can then be synthesized from the general synthetic methods described below in Schemes III-IX. The first general method shown in Scheme III involves a Weinreb amide formation from reaction of either the trichloroacetyl-protected or free urea with an amino aluminate organometallic complex.

Scheme III

- 33 -

An alternate method for the generation of similar compounds is described in Scheme IV. This general route utilizes the same starting 2-aminothiophene ester from Scheme III but amide bond formation is executed from the reaction of the corresponding carboxylic acids with various amines. A variety of coupling agents can be used to effect this transformation including EDCI, DIC, BOP, and HATU under standard coupling methods very familiar to those practicing and trained in the art of organic synthesis. Generation of the final primary urea is then performed using a simple two-step reaction with trichloroacetylisocyanate followed by cleavage with ammonia in methanol.

Scheme IV

As shown in the following Schemes V-VII, the amide product formed prior to urea generation in Scheme IV can be used as a common intermediate for the formation of various substituted ureas where  $R^4$  is not hydrogen. Reaction with isocyanates, acyl azides (in particular pyrazine acyl azides), or carbonyldiimidazole and amines (in particular hydroxylamine hydrochloride), leads to the creation of various substituted secondary ureas where  $R^4$  is selected from OH, optionally substituted carbocyclyl, optionally substituted heterocyclyl, or optionally substituted  $C_{1-6}$ alkyl.

Scheme VII

- 10 An additional general process presented in this invention involves an improvement on the construction of general compounds with formula (I). The method, which employs a Suzuki Coupling of a 5-bromothiophene intermediate as its key transformation, is shown in Scheme VIII. This method allows for increased diversity much later in the synthesis and is amenable to parallel combinatorial methods of organic synthesis. Commercially available 2-amino-
- 15 thiophene-3-carboxylic acid methyl ester is protected as the trichloroacetyl urea, followed by selective bromination at the 5-position with bromine in acetic acid. Removal of the protecting group with ammonia in methanol, followed by Weinreb amidation yields the common intermediate. Standard Suzuki reaction conditions are then employed to finally generate the target compounds.

- 35 -

Scheme VIII

5

If the final compound generated from any of the above-mentioned methods or schemes has a protecting group on nitrogen (in particular a carbamate) or oxygen (in particular an ether or ester) present anywhere on the molecule standard methods of removal can be utilized to generate final compounds. Shown in Scheme IX is the general method used for the deprotection of a tert-butoxycarbonyl carbamate to yield the secondary amine product ( $R^2 = \text{XNHR}^3$ ) as the corresponding hydrochloride or trifluoroacetate salt. Cleavage of methyl ethers to phenols (not shown) is affected by reaction with boron tribromide in methylene chloride. Both of these methods are very familiar with those trained in the art of organic synthesis.

**Example 4****2-[(Aminocarbonyl)amino]-5-(4-methoxyphenyl)-N-[(3S)-piperidin-3-yl]thiophene-3-carboxamide**

**(4-Methoxy-phenyl)-acetaldehyde.** To a stirred solution of (4-Methoxy-phenyl)-acetic acid methyl ester (18.0 g, 100 mmol) in anhydrous toluene (200 mL) cooled to  $-78^{\circ}\text{C}$  under  $\text{N}_2$  was added diisobutylaluminum hydride (DIBAL, 1.0 M in toluene, 150 mL, 150 mmol) over a period of 10-15 minutes. The mixture was stirred at  $-78^{\circ}\text{C}$  for an additional 2h. The reaction was quenched by the slow addition of MeOH, followed by the introduction of 10% Rochelle's Salt. The suspension was diluted with EtOAc and stirred at room temperature for 1h. The EtOAc layer was set aside and the aqueous layer was extracted with EtOAc(2x). The combined organic layers were combined and dried over  $\text{Na}_2\text{SO}_4$  and filtered. The solution was concentrated under vacuum to yield 12.0 g (100%) of the title aldehyde as a yellow viscous semisolid, which was used in the next step without purification. LC/MS (APCI, ES,  $\text{M}+\text{H}=151$ ).

**2-Amino-5-(4-methoxy-phenyl)-thiophene-3-carboxylic acid methyl ester.** To a solution of 4-methoxyphenylacetaldehyde (12.0g) in DMF (200mL) was added cyanomethyl acetate (8.9 mL, 100 mmol) and sulfur (3.2g, 100mmol), followed by diisopropylethylamine (Hunig's Base, 17.4 mL, 100 mmol). The resultant suspension immediately turned dark yellow to brown with an exotherm. The reaction mixture was stirred overnight at room temperature. The reaction was slowly added to water (~1L) while stirring. A tan precipitate formed and was filtered after an additional 30 minutes of stirring. The resultant solid was purified by column chromatography ( $\text{SiO}_2$ , 10-20% EtOAc/ hexanes) to yield 15.3 g (58%) of the title compound as a light yellow

5 **carboxylate.** To a stirred solution of 2-Amino-5-(4-methoxy-phenyl)-thiophene-3-carboxylic acid methyl ester (7.15 g, 27.2 mmol) in anhydrous THF (150 mL) was added trichloroacetyl isocyanate (6.4 mL, 54 mmol) slowly over a period of 5 min. After the addition was complete, a precipitate formed and the reaction stirred for an additional 1h. The desired product was obtained by filtration to give 6.9 g (56%) an off-white solid. The product was used in the next step  
10 without purification  $^1\text{H}$  NMR ( $d_6$ -DMSO  $\delta$  12.3, br s, 1H;  $\delta$  12.2, s, 1H;  $\delta$  7.46, d, 2H;  $\delta$  7.32, s, 1H;  $\delta$  6.85, d, 2H;  $\delta$  3.75, s, 3H;  $\delta$  3.66, s, 3H), LC/MS (APCI, ES,  $M+H=451$ ).

15 methoxyphenyl)-2-(((trichloroacetyl)amino)carbonyl)amino)thiophene-3-carboxylate (1.0 g, 2.2 mmol) in dry THF (20 mL) was added a solution of  $[\text{Me}_2\text{Al}-3\text{-Boc-(S)-3-aminopiperidine}]$  in THF (which was preformed by the addition of  $\text{Me}_3\text{Al}$  (2.0 M in hexanes, 2.2 mL, 4.4 mmol) to a solution of (S)-3-Amino-piperidine-1-carboxylic acid *tert*-butyl ester (0.89 g, 4.4 mmol) in 10 mL THF at  $-78^\circ\text{C}$  followed by warming to room temperature for an additional 15 min). The  
20 resulting orange-colored solution was stirred overnight at room temperature. The reaction mixture was cooled with ice and a 10% aqueous solution of Rochelle's salt was added slowly to quench the reaction. The resulting biphasic solution was warmed to room temperature and stirred for an additional 1h. The mixture was diluted with EtOAc and  $\text{H}_2\text{O}$ , the aqueous layer was extracted with EtOAc (3x) and the combined organic extracts were washed with  $\text{H}_2\text{O}$ , brine and  
25 dried ( $\text{Na}_2\text{SO}_4$ ). Evaporation gave a pale orange solid. Purification by column chromatography ( $\text{SiO}_2$ , 50 % EtOAc/hexanes) gave 0.70 g (67%) of a light yellow solid. LC/MS (APCI, ES,  $M+H=475$ ).

A small amount of precipitate forms shortly and the reaction is stirred for an additional 4h at room temperature. The solvent was removed under vacuum. The residue was redissolved in methanol and concentrated under vacuum (2x) to yield 0.51 g (85%) of a light yellow solid. <sup>1</sup>H NMR (d<sub>6</sub>-DMSO δ 10.9, s, 1H; δ 9.39, br s, 1H; δ 9.20, br s, 1H; δ 8.37, d, 1H; δ 7.88, s, 1H; δ 7.49, d, 2H; δ 6.96, d, 2H; δ 6.97, br s, 2H; δ 4.24, m, 1H; δ 3.77, s, 3H; δ 3.29, m, 1H; δ 3.11, m, 1H; δ 2.93, m, 2H; δ 1.91, m, 2H; δ 1.68, m, 2H), LC/MS (APCI, ES, M+H=6875).

**(S)-3-Amino-azepane-1-carboxylic acid tert-butyl ester.** (S)-Azepan-3-ylamine (5g; 43.8 mmol) was dissolved in 100 mL of anhydrous CH<sub>2</sub>Cl<sub>2</sub> and cooled to -78 °C while stirring with a magnetic stirring bar. In another flask N-(tert-butoxycarbonyloxy)succinimide [Boc-OSu] (9.7 g; 45 mmol) was dissolved in 50 mL of anhydrous CH<sub>2</sub>Cl<sub>2</sub>. **Methyl 5-bromo-2-([[(trichloroacetyl)amino]carbonyl]amino)thiophene-3-carboxylate.** To a stirred solution of methyl 2-([[(trichloroacetyl)amino]carbonyl]amino)thiophene-3-carboxylate (1 eq) in glacial acetic acid (20 mL) was added a solution of bromine (1.3 eq) in glacial acetic acid (5 mL) slowly over a period of 5 min. After the addition was complete, the resulting dark solution was stirred for 30 mins at RT. The solvent was evaporated under vacuum and the residue was triturated with H<sub>2</sub>O. The title compound was obtained by filtration (99%) as an off-white solid. The product was used in the next step without any further purification after drying for 2 days under P<sub>2</sub>O<sub>5</sub>. LC/MS (ES, M+H=425).

**Methyl 2-[(aminocarbonyl)amino]-5-bromothiophene-3-carboxylate.** A stirred solution of methyl 5-bromo-2-([[(trichloroacetyl)amino]carbonyl]amino)thiophene-3-carboxylate (1 eq) in

anhydrous methanol was purged with dry ammonia for 20 mins. After stirring for extra 10 mins at RT, precipitation was observed and the product was isolated by filtration (100% yield). LC/MS (ES, M+H=280).

5 ***tert*-Butyl(3*S*)-3-[(2-[(aminocarbonyl)amino]-5-bromo-3-thienyl)carbonyl)amino]piperidine-1-carboxylate**

To a solution of methyl 2-[(aminocarbonyl)amino]-5-bromothiophene-3-carboxylate (1 equiv) in dry THF (0.3 M) was added a solution of [Me<sub>2</sub>Al-Boc-3-(*S*)-aminopiperidine] (2 equiv) in THF (1.0M) (which was preformed by the addition of Me<sub>3</sub>Al (2.0M in hexanes) to a solution of Boc-3-  
10 (S)-piperidine in THF at -78°C and the resulting yellow solution was warmed to room temperature and stirred for an additional 15 min) and the resulting deep yellow solution was stirred overnight at room temperature. The reaction mixture was cooled with ice and a 10% aqueous solution of Rochelle's salt was added slowly to quench the reaction. The resulting biphasic solution was warmed to room temperature and stirred for an additional 1h. The mixture  
15 was diluted with EtOAc and H<sub>2</sub>O, the aqueous layer was extracted with EtOAc (3x) and the combined organic extracts were washed with H<sub>2</sub>O, brine and dried (MgSO<sub>4</sub>). Evaporation gave a pale orange solid. Purification by column chromatography (40-60% EtOAc/Hexanes) gave a white solid. <sup>1</sup>H NMR (d<sub>6</sub>-DMSO, δ 10.9, s, 1H; δ 9.48, br s, 1H; δ 9.31, br s, 1H; δ 8.48, d, 1H; δ 8.10, s, 1H; δ 7.57, d, 2H; δ 7.38, t, 2H; δ 7.23, t, 1H; δ 7.01, br s, 2H; δ 4.26, m, 1H; δ

***tert*-Butyl (3*S*)-3-([2-[(aminocarbonyl)amino]-5-(3-methoxyphenyl)-3-thienyl]carbonyl)amino)piperidine-1-carboxylate** A flask was loaded with *tert*-butyl(3*S*)-3-  
25 [(2-[(aminocarbonyl)amino]-5-bromo-3-thienyl)carbonyl)amino] piperidine-1-carboxylate (1.0 mmol), 3-methoxyphenylboronic acid (1.5 mmol), Cs<sub>2</sub>CO<sub>3</sub> (3.0 mmol) and Pd(PPh<sub>3</sub>)<sub>4</sub> (0.05-0.1 mmol) and was purged with nitrogen for 10 mins. Dioxane (4 mL) and H<sub>2</sub>O (1 mL) were added under nitrogen atmosphere and the resulting mixture was heated to 90 °C for 2-4h. The mixture was allowed to cool to RT and the mixture was filtered (0.45 uM or diatomaceous earth). The  
30 water layer was separated and remaining solvent was concentrated to dryness. The residue was
